Bemchmark test with mrgsolve and NONMEM

Metrum Research Group

Contents

1 mrgsolve package version

```
packageVersion("mrgsolve")
```

```
## [1] '1.0.3'
```

2 Introduction

This document runs simulations from a pharmacokinetic model using both NONMEM and mrgsolve and compares the results.

All of the relevant code is presented so that the user can trace how the simulations are performed. The complete source code can be viewed here.

The bottom line results are presented in graphical form here and numeric form here.

3 Setup

```r
Sys.setenv(RSTUDIO_PANDOC = "/usr/lib/rstudio-server/bin/pandoc")
```

```r
mrgsolve.loc <- NULL
library(mrgsolve, lib.loc = mrgsolve.loc)
```

```r
library(dplyr)
library(data.table)
library(ggplot2)
library(purrr)
library(tidyr)
library(jsonlite)
library(tools)
library(parallel)
```

```r
stopifnot(grepl("PsN", system("execute --version", intern=TRUE)))
```

4 Functions

These functions assemble data sets, run simulations, and gather outputs. All scenarios are handled in exactly the same way.

4.1 Save `mrgsim` output as a `nonmem` input data set

```r
to_data_set <- function(x, id = NULL) {
  x <- as.data.frame(x)
  x <- mutate(x, C = '.', DV = '.', cmt = if_else(cmt==0, 2, cmt))
  x <- select(x, "C", everything())
  if(is.numeric(id)) x <- mutate(x,ID = id)
  x
}
```

4.2 Save the `nonmem` input data set

```r
sv <- function(x,file) {
  fwrite(file = file, quote = FALSE, x, na = '.')
}
```

4.3 Run `nonmem`

```r
run <- function(number) {
  #execute -model_subdir -silent -directory=run1001 model/1001.ctl
  directory <- paste0("-directory=", number)
  target <- paste0("model/", number, ".ctl")
  args <- c("-silent", "-model_subdir", directory, target)
  system2("execute", args=args)
```

```
    return(tabread(number))
}
```

4.4   Read in `nonmem` simulation results

```
tabread <- function(number) {
  tab <- file.path(number, "TAB")
  if(file.exists(tab)) return(fread(tab, skip=1))
  stop("the run failed")
}
```

4.5   Simulate a scenario with `mrsim()`

```
sim <- function(x, e,...) {
  carry <- c("cmt", "amt","ii", "addl", "rate", "evid", "ss")
  mrgsim(x, events = e, carry_out = carry, digits = 5, recsort = 3, ...)
}
```

5   The `mrgsim()` model

```
mod <- mread_cache("model/1001.mod")
```

```
. Building 1001_mod ... done.
```

```
mod <- update(mod, end = 130, delta = 1)
```

6   Assemble the scenarios

There is a lot of code here. See the results section to see input data objects next to simulated data output from mrgsolve and NONMEM.

- Doses into `cmt` 2 are intravascular and doses into `cmt` 1 are extravascular
- `LAGT` sets the dosing lag time
- `BIOAV` sets the bioavailability fraction

```
env <- new.env()
env$ev <- list()
env$descr <- list()
push_back <- function(env, ev, descr) {
  n <- length(env$ev)+1
  m <- length(env$descr)+1
  env$ev[[n]] <- ev
  env$descr[[m]] <- descr
}
```

```
ev <- ev(amt = 100, ii = 24, addl = 3)
push_back(env,ev, "Bolus with additional")
```

```
ev <- ev(amt = 100, ii = 24, addl = 3, LAGT = 12.13, BIOAV = 2.23, cmt = 2)
push_back(env, ev,"Bolus with lag time and bioav")
```

```r

```
ev <-
  ev(amt = 100, ii = 24, addl = 3, ss = 1)  +
  ev(amt = 50,  ii = 24, addl = 3, ss = 2, time = 12)
push_back(env,ev,"Steady state 1 and 2")
```

```
ev <- ev(amt = 0, rate = 100,  ss=1)
push_back(env,ev,"Steady state infusion")
```

```
update_id <- function(ev,id) mutate(ev, ID = id)
```

```
runs <- tibble(ev = env$ev, descr = env$descr)
runs <- mutate(runs, ID = seq(n()))
runs <- mutate(runs, ev = map2(ev, ID, update_id))
runs <- mutate(runs, sims = mclapply(ev, sim, x = mod))
runs <- mutate(runs, data = map(sims, to_data_set))
```

```
data <- bind_rows(runs$data)
data$CP <- NULL

sv(data, "data/1001.csv")
```

7   Simulate with `nonmem`

```
nm <- run(1001)
```

8   Numeric Summary

Look at the difference between simulated values from mrgsolve and NONMEM.

```
runs <- mutate(runs, nm = split(nm, nm$ID))

runs <- mutate(
  runs,
  comp = map2(nm, sims, .f = function(nonmem, mrgsolve) {
    tibble(
      ID = nonmem$ID,
      time = mrgsolve$time,
      MRGSIM = mrgsolve$CP,
      NONMEM = nonmem$CP,
      diff = MRGSIM-NONMEM
    )
  })
)
```

```
comp <- select(runs, comp) %>% unnest(cols = c(comp))
```

8.1 Overall

This is the nonmem minus mrgsim() summary

```
summary(comp$diff)
```

```
.    Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
.       0       0       0       0       0       0
```

8.2 Summary by scenario number

diff is the simulated CP from nonmem minus the simulated CP from mrgsim()

```
group_by(comp, ID) %>%
  summarise(mean = mean(diff), max = max(diff), min = min(diff)) %>%
  as.data.frame()
```

```
.     ID mean max min
. 1    1    0   0   0
. 2    2    0   0   0
. 3    3    0   0   0
